

## Apache Module mod\_echo

|                           |   |
|---------------------------|---|
| <b>Description:</b>       | A simple echo server to illustrate protocol modules |
| <b>Status:</b>            | Experimental  |
| <b>Module Identifier:</b> | echo_module   |
| <b>Source File:</b>       | mod_echo.c  |
| <b>Compatibility:</b>     | Available in Apache 2.0 and later                   |

### Summary

This module provides an example protocol module to illustrate the concept. It provides a simple echo server. Telnet to it and type stuff, and it will echo it.

### Directives

ProtocolEcho ..... 1

### ProtocolEcho Directive

---

|                       |  |
|-----------------------|--|
| <b>Description:</b>   | Turn the echo server on or off                   |
| <b>Syntax:</b>        | ProtocolEcho On Off                              |
| <b>Context:</b>       | server config, virtual host                      |
| <b>Status:</b>        | Experimental                                     |
| <b>Module:</b>        | mod_echo   |
| <b>Compatibility:</b> | ProtocolEcho is only available in 2.0 and later. |

The `ProtocolEcho` directive enables or disables the echo server.

#### Example

```
ProtocolEcho On
```
